This report provides an update of the high pathogenicity avian influenza (HPAI) situation, according to the information submitted through the World Animal Health Information System of the World Organisation for Animal Health (OIE-WAHIS) between 18 November and 8 December 2021.

**Seasonal trend**

Using data reported to the OIE between 2005 and 2019 by 76 affected countries and territories for 18,620 outbreaks in poultry, we used a Seasonal and Trend decomposition using Loess (STL) analysis to determine the seasonal pattern of the disease (detailed methodology presented in Awada et al., 2018). Based on the data reported to the OIE, spread is lowest in September, begins to rise in October, and peaks in February. Figure 1 shows the global seasonal pattern of HPAI in poultry and the red rectangle indicates where we currently are in the cycle based on the period covered in “recent updates” below.

**Recent updates (18/11/2021 – 08/12/2021)**

To describe the current disease situation of HPAI in poultry and in non-poultry birds, this section covers: (a) a list of new events which started during the 3-week period (reported through immediate notifications); (b) information on events that started before the 3-week period but were still ongoing during that period; and (c) the geographic distribution of new outbreaks that started during the 3-week period, outbreaks that started before the 3-week period but were still ongoing during that period. The different subtypes of HPAI circulating during the 3-week period are also listed below. This information is based on the immediate notifications and follow-up reports received by the OIE.

**HPAI in poultry**

**New events by world region (reported through immediate notifications)**

**Europe**

*Subtype pending*

A recurrence started in Bulgaria (Pazardzhik) on 1 December 2021.

*Subtype H5*

A recurrence started in Russia (Stavropol') on 1 December 2021.

*Subtype H5N1*

A recurrence started in Croatia (Sisacko-Moslavacka) on 18 November 2021.

A recurrence started in Ireland (Monaghan) on 19 November 2021.

4 recurrences started in Hungary:

- In Békés on 19 November 2021,

---

1. As defined in Article 1.1.2. of the OIE Terrestrial Animal Health Code, an “event” means a single outbreak or a group of epidemiologically related outbreaks of a given listed disease or emerging disease that is the subject of a notification. An event is specific to a pathogenic agent and strain, when appropriate, and includes all related outbreaks reported from the time of the initial notification through to the final report. Reports of an event include susceptible species, the number and geographical distribution of affected animals and epidemiological units.

2. As defined in the glossary of the OIE Terrestrial Animal Health Code, an “outbreak” means the occurrence of one or more cases in an epidemiological unit.
On-going events for which there were new reported outbreaks, by world region (reported through follow-up reports):

**Africa**
- Subtype H5N1
  - Nigeria

**Asia**
- Subtype H5
  - Pakistan
- Subtype H5N1
  - Israel, Japan, Korea (Rep. Of)
- Subtype H5N5
  - Iran

**Europe**
- Subtype pending
  - Bulgaria
- Subtype H5N1
  - Czech Republic, Germany, Hungary, Italy, Netherlands, Poland, Switzerland, United Kingdom

**Americas and Oceania**
- No new outbreaks reported in the on-going events, or no on-going events

New outbreaks and associated subtypes

During the period covered by this report, a total of 181 new outbreaks in poultry were reported by 21 countries (Belgium, Bulgaria, Croatia, Czech Republic, France, Germany, Hungary, Iran, Ireland, Israel, Italy, Japan, Korea (Rep. of), Netherlands, Nigeria, Pakistan, Poland, Russia, Slovakia, Switzerland, United Kingdom). Details are presented in Figures 2 and 3.
HIGH PATHOGENICITY AVIAN INFLUENZA (HPAI) – SITUATION REPORT

Figure 2. Distribution of HPAI new outbreaks in poultry, and corresponding subtypes

Figure 3. Number of new outbreaks and associated losses by geographical region (losses include animals dead and killed and disposed of)

HPAI in non-poultry

New events by world region (reported through immediate notifications)

**Asia**
- **Subtype H5N1**: The first occurrence of H5N1 started started in Hebei in China (People's Rep. of) on 20 November 2021. A recurrence started in Israel (HaMerkaz) on 29 November 2021.

**Subtype H5N8**: A recurrence started in Japan (Kagoshima) on 19 November 2021. A recurrence started in Iran (Markazi and Mazandaran) on 25 November 2021. A recurrence started in India (Madhya Pradesh) on 28 November 2021.

**Europe**
- **Subtype H5**
2 recurrences started in Russia:
- In Kaliningrad on 18 December 2021, and
- In Kursk on 22 November 2021.
A recurrence started in Hungary (Zala) on 22 November 2021.
A recurrence started in Austria (Niederösterreich) on 23 November 2021.
A recurrence started in Switzerland (Zürich) on 23 November 2021.

**Subtype H5N1**

2 recurrences started in Slovakia:
- In Trnavský on 24 November 2021, and
- In Banskobystrický on 24 November 2021.
A recurrence started in Germany (Nordrhein-Westfalen) on 26 November 2021.
A recurrence started in Luxembourg (Grevenmacher) on 27 November 2021.
The first occurrence of H5N1 started started in Setúbal in Portugal on 30 November 2021.

**Africa, Americas, and Oceania**
No new events reported

**On-going events for which there were new reported outbreaks, by world region (reported through follow-up reports):**

**Asia**
Subtype H5N1
India

**Europe**
Subtype H5
Russia
Subtype H5N1
Belgium, Croatia, Czech Republic, Estonia, France, Germany, Ireland, Italy, Netherlands, Poland, Romania, Sweden, United Kingdom
Subtype H5N8
Netherlands

**Africa, Americas, and Oceania**
No new outbreaks reported in the on-going events, or no on-going events.

**New outbreaks**

During the period covered by this report, a total of 107 outbreaks in non-poultry were reported by 25 countries (Austria, Belgium, China (People’s Rep. of), Croatia, Czech Republic, Estonia, France, Germany, Hungary, India, Iran, Ireland, Israel, Italy, Japan, Luxembourg, Netherlands, Poland, Portugal, Romania, Russia, Slovakia, Sweden, Switzerland, United Kingdom). Details are presented in Figures 4 and 5.
High pathogenicity avian influenza (HPAI) is caused by influenza A viruses in the family Orthomyxoviridae. Since its identification in China (People’s Rep. of) in 1996, there have been four waves of intercontinental transmission of the H5Nx Gs/GD lineage virus:

1) in 2005-2006, H5N1 clade 2.2 virus involving Africa, Asia and Europe;
2) in 2009-2010, clade 2.3.2.1c virus affecting Asia and Europe;
3) in 2014-2015, at the same time clade 2.3.4.4a H5N8 virus as well as clade 2.3.2.1c H5N1 virus involving Africa, Asia, and Europe; and
4) in 2016-2017, 2.3.4.4b H5Nx clade also involving Africa, Asia, and Europe\(^4\).

---

HPAI has resulted in the death and mass slaughter of more than 246 million poultry worldwide between 2005 and 2020, with peaks in 2006 and 2016. During these two particular years, about a quarter of the world’s countries were affected with HPAI. In addition, up to now, humans have occasionally been infected with subtypes H5N1 (around 850 cases reported, of which half died), H7N9 (around 1,500 cases reported), H5N6 (around 50 cases reported, of which half died) and sporadic cases have been reported with subtypes H7N7 and H9N2.

Key messages

The current HPAI epidemic season continues with a high number of outbreaks in poultry and non-poultry reported in Europe, and also in a few countries in Africa and Asia over the 3 weeks covered by the report. Most of them are due to the subtype H5N1. This indicates a possible introduction and spread of the virus through current wild bird migration. The increased number of notifications reflects the annual seasonal pattern of HPAI cases. Based on this known pattern, further increase in HPAI spread is expected in several regions in the coming months. In addition, an increase in the number of human cases infected with H5N6 subtype viruses has recently been observed in China (People’s Rep. of) for which the World Health Organization (WHO) published a risk assessment. In this context, the World Organisation for Animal Health (OIE) urges countries to intensify surveillance efforts, implement strict biosecurity measures at farm level to prevent the introduction of the disease, continue timely reporting of avian influenza outbreaks in both poultry and non-poultry species, and maintain the high quality of the information provided to support early detection and rapid response to potential threats to both animal and public health.
