This report provides an update of the high pathogenicity avian influenza (HPAI) situation, according to the information submitted through the World Animal Health Information System of the World Organisation for Animal Health (OIE-WAHIS) between 17 February 2022 and 9 March 2022.

Seasonal trend

Using data reported to the OIE between 2005 and 2019 by 76 affected countries and territories for 18,620 outbreaks in poultry, we carried out a Seasonal and Trend decomposition using Loess (STL) analysis to determine the seasonal pattern of the disease (detailed methodology presented in Awada et al., 2018\(^5\)). Based on the data reported to the OIE, spread is lowest in September, begins to rise in October, and peaks in February. Figure 1 shows the global seasonal pattern of HPAI in poultry and the red rectangle indicates where we currently are in the cycle based on the period covered in “recent updates” below.

Figure 1. Seasonal trend in global HPAI incidence in poultry

Recent updates (17/02/2022 – 09/03/2022)

To describe the current disease situation of HPAI in poultry and in non-poultry birds, this section covers: (a) a list of new events\(^1\) which started during the 3-week period (reported through immediate notifications); (b) information on events that started before the 3-week period but were still ongoing during that period; (c) the geographic distribution of new outbreaks\(^2\) that started during the 3-week period and d) events which started before the 3-week period but were reported during the 3-week period. The different subtypes of HPAI circulating during the 3-week period are also listed below. This information is based on the immediate notifications and follow-up reports received by the OIE.

HPAI in poultry

New events by world region (reported through immediate notifications)

- **Europe**
  - Subtype H5N2
    - The first occurrence of H5N2 in Opolskie in Poland started on 28 February 2022.

- **Africa, Americas, Asia and Oceania**
  - No new events reported

On-going events for which there were new reported outbreaks, by world region (reported through follow-up reports):

- **Africa**
  - Subtype H5N1

---

\(^1\) As defined in Article 1.1.2. of the OIE Terrestrial Animal Health Code, an “event” means a single outbreak or a group of epidemiologically related outbreaks of a given listed disease or emerging disease that is the subject of a notification. An event is specific to a pathogenic agent and strain, when appropriate, and includes all related outbreaks reported from the time of the initial notification through to the final report. Reports of an event include susceptible species, the number and geographical distribution of affected animals and epidemiological units.

\(^2\) As defined in the glossary of the OIE Terrestrial Animal Health Code, an “outbreak” means the occurrence of one or more cases in an epidemiological unit.
South Africa

Americas
Subtype H5N1
United States of America

Asia
Subtype H5N1
Korea (Rep. Of), Nepal, Philippines

Europe
Subtype H5N1
France, Germany, Italy, Netherlands, Poland, Portugal, Spain, United Kingdom

Oceania
No new outbreaks reported in the on-going events, or no on-going events

New outbreaks and associated subtypes

During the period covered by this report, a total of 120 new outbreaks in poultry were reported by 13 countries (France, Germany, Italy, Korea (Rep. of), Nepal, Netherlands, Philippines, Poland, Portugal, South Africa, Spain, United Kingdom, and United States of America). Details are presented in Figures 2 and 3.

Figure 2. Distribution of HPAI new outbreaks in poultry, and corresponding subtypes
Events which started before the 3-week period but were reported during the 3-week period (reported through immediate notifications)

**Asia**
- **Subtype H5N1**
  - The first occurrence of H5N1 in Bulacan and Pampanga in Philippines started on 6 January 2022.
  - A recurrence started in India (Maharashtra) on 2 February 2022.

**Africa, Americas, Europe, and Oceania**
- No events reported

**HPAI in non-poultry**

New events by world region (reported through immediate notifications)

**Asia**
- **Subtype H5N1**
  - A recurrence started in Nepal (Central) on 22 February 2022.

**Europe**
- **H5N1**
  - The first occurrence of H5N1 in Štip in North Macedonia started on 17 February 2022.
  - The first occurrence of H5N1 in Jersey in United Kingdom started on 22 February 2022.

**Americas, Asia and Oceania**
- No new events reported

On-going events for which there were new reported outbreaks, by world region (reported through follow-up reports):

**Americas**
- **Subtype H5N1**
  - United States of America

**Asia**
- **Subtype H5N1**
  - Korea (Rep. Of)

**Europe**
- **Subtype H5N1**
  - Belgium, Czech Republic, France, Germany, Greece, Ireland, Lithuania, Poland, Portugal, Romania, Spain, Sweden, Switzerland, United Kingdom

**Africa and Oceania**
- No new outbreaks reported in the on-going events, or no on-going events.
New outbreaks

During the period covered by this report, a total of 96 outbreaks in non-poultry were reported by 18 countries and territories (Belgium, Czech Republic, France, Germany, Greece, Ireland, Korea (Rep. of), Lithuania, Nepal, North Macedonia, Poland, Portugal, Romania, Spain, Sweden, Switzerland, United Kingdom, United States of America). Details are presented in Figures 4 and 5.

![Bar Chart of New Outbreaks](image)

**Figure 5.** Number of new outbreaks by geographical region

**Events which started before the 3-week period but were reported during the 3-week period (reported through immediate notifications)**

**Asia**

*Subtype H5*

A recurrence started in Japan (Hokkaido) on 23 January 2022.

**Europe**

*Subtype H5N1*

The first occurrence started in Karpoš in North Macedonia on 4 February 2022.

The first occurrence of H5N1 started in Kauno in Lithuania on 9 February 2022.
Epidemiological background

High pathogenic avian influenza (HPIA) is caused by influenza A viruses in the family Orthomyxoviridae. Since its identification in China (People’s Rep. of) in 1996, there have been four waves of intercontinental transmission of the H5Nx Gs/GD lineage virus:

- 1) in 2005-2006, H5N1 clade 2.2 virus involving Africa, Asia and Europe;
- 2) in 2009-2010, clade 2.3.2.1c virus affecting Asia and Europe;
- 3) in 2014-2015, at the same time clade 2.3.4.4a H5N8 virus as well as clade 2.3.2.1c H5N1 virus involving Africa, Asia, and Europe; and
- 4) in 2016-2017, 2.3.4.4b H5Nx clade also involving Africa, Asia, and Europe4,4.

HPIA has resulted in the death and mass slaughter of more than 246 million poultry worldwide between 2005 and 2020, with peaks in 2006 and 2016. During these two particular years, about a quarter of the world’s countries were affected with HPIA5. In addition, up to now, humans have occasionally been infected with subtypes H5N1 (around 850 cases reported, of which half died), H7N9 (around 1,500 cases reported), H5N6 (around 70 cases reported, of which about 30 died) and sporadic cases have been reported with subtypes H7N7 and H9N26,7,8,9,10.

Key messages

The current HPIA epidemic season continues with outbreaks being reported in poultry and non-poultry mainly in Europe, and also in Africa, Americas and Asia over the 3 weeks covered by the report. Across Europe, various countries continue to note the ongoing infection pressure posed by wild birds with Greece reporting significant mass mortality of Dalmatian pelicans during this period. The predominant subtype noticed in the current epidemic season is subtype H5N1. Compared with previous reports, the number of new events has decreased globally, and based on the known global annual seasonal trend of HPIA cases, the spread of HPIA is expected to continue to decline in the coming weeks and months as the February peak has passed. However, the trend can vary between years and world sub-regions, and given the continued reports of wild bird cases, the World Organisation for Animal Health (OIE) urges countries to maintain their surveillance efforts, implement strict biosecurity measures at farm level to prevent the introduction of the disease, continue timely reporting of avian influenza outbreaks in both poultry and non-poultry species, and maintain the high quality of the information provided to support early detection and rapid response to potential threats to both animal and public health.
