Situation report period covered: 17 February to 9 March 2023

This report provides an update of the high pathogenicity avian influenza (HPAI) situation, according to the information submitted through the World Animal Health Information System of the World Organisation for Animal Health (WAHIS) between 17 February and 9 March 2023.

Seasonal trend

Using data reported to the World Organisation for Animal Health (WOAH) between 2005 and 2019 by 76 affected countries and territories for 18,620 outbreaks in poultry, we carried out a Seasonal and Trend decomposition using Loess (STL) analysis to determine the seasonal pattern of the disease (detailed methodology presented in Awada et al., 2018\(^1\)). Based on the data reported to WOAH, spread is lowest in September, begins to rise in October, and peaks in February. Figure 1 shows the global seasonal pattern of HPAI in poultry and the red rectangle indicates where we currently are in the cycle based on the period covered in “recent updates” below.

Recent updates (17/02/2023-9/03/2023)

To describe the current disease situation of HPAI in poultry and in non-poultry birds, this section covers: (a) a list of new events\(^2\) which started during the 3-week period (reported through immediate notifications); (b) information on events that started before the 3-week period but were still ongoing during that period; (c) the geographic distribution of new outbreaks\(^3\) that started during the 3-week period and d) events which started before the 3-week period but were reported during the 3-week period. The different subtypes of HPAI circulating during the 3-week period are also listed below. This information is based on the immediate notifications and follow-up reports received by WOAH.

HPAI in poultry

New events by world region (reported through immediate notifications)

- **Americas**
  - **H5**
    - The first occurrence in the country started in Argentina (Buenos Aires and Río Negro) on 24 February 2023

- **Europe**
  - **Subtype H5N1**
    - A recurrence started in Slovenia (Gorenjska) on 24 February 2023 (Clade 2.3.4.4b; Lineage: Fully Eurasian)
    - A recurrence of the strain started in Italy (Veneto) on 6 March 2023

---

\(^2\) As defined in Article 1.1.2. of the WOAH Terrestrial Animal Health Code, an “event” means a single outbreak or a group of epidemiologically related outbreaks of a given listed disease or emerging disease that is the subject of a notification. An event is specific to a pathogenic agent and strain, when appropriate, and includes all related outbreaks reported from the time of the initial notification through to the final report. Reports of an event include susceptible species, the number and geographical distribution of affected animals and epidemiological units.

\(^3\) As defined in the glossary of the WOAH Terrestrial Animal Health Code, an “outbreak” means the occurrence of one or more cases in an epidemiological unit.
Africa, Asia, and Oceania
No new events reported

On-going events for which there were new reported outbreaks, by world region (reported through follow-up reports):

**Americas**
- Subtype H5N1
- United States of America

**Asia**
- Subtype H5N1
- Türkiye

**Europe**
- Subtype H5N1
- Belgium, France, Germany, Hungary, and Poland

**Africa, and Oceania**
No new outbreaks reported in the on-going events, or no on-going events

**New outbreaks and associated subtypes**

During the period covered by this report, a total of 44 new outbreaks in poultry were reported by 10 countries (Argentina, Belgium, France, Germany, Hungary, Italy, Poland, Slovenia, Türkiye, United States of America). Details are presented in Figures 2 and 3.

*Figure 2. Distribution of HPAI new outbreaks in poultry, and corresponding subtypes*
Events which started before the 3-week period but were reported during the 3-week period (reported through immediate notifications)

**Europe**
- Subtype H5N1
  - A recurrence started in Estonia (Rapla) on 15 February 2023.

**Africa, Americas, Asia and Oceania**
- No events reported

### HPAI in non-poultry

New events by world region (reported through immediate notifications)

**Americas**
- Subtype H5
  - The first occurrence started in Uruguay (Tacuarembó) started on 3 March 2023

**Asia**
- Subtype H5N1
  - A recurrence started in Cambodia (Prey Vêng) started on 24 February 2023

**Europe**
- Subtype H5N1
  - A recurrence started in United Kingdom (Isle of Man) started on 28 February 2023

**Africa, and Oceania**
- No new events reported

On-going events for which there were new reported outbreaks, by world region (reported through follow-up reports):

**Americas**
- H5
- Argentina, Chile
- H5N1
- Chile (Clade: 2.3.4.4b - Lineage: Reassortment Eurasian and North American), Colombia (Clade: 2.3.4.4b - Lineage: Reassortment Eurasian and North American), United States of America

**Asia**
- H5
- Japan

**Europe**
- H5
- Belgium
- H5N1
- Austria, Belgium, Czech Republic, Germany, Hungary, Italy, Poland, Romania, Slovenia (Clade 2.3.4.4b - Lineage: Fully Eurasian), Sweden, Switzerland and United Kingdom

**Africa, and Oceania**
- No new outbreaks reported in the on-going events, or no on-going events.
New outbreaks

During the period covered by this report, a total of 161 outbreaks in non-poultry were reported by 19 countries (Argentina, Austria, Belgium, Cambodia, Chile, Colombia, Czech Republic, Germany, Hungary, Italy, Japan, Poland, Romania, Slovenia, Sweden, Switzerland, United Kingdom, United States of America and Uruguay). Details are presented in Figures 4 and 5.

![Bar chart showing number of new outbreaks by geographical region.]()  
*Figure 5. Number of new outbreaks by geographical region.*

Events which started before the 3-week period but were reported during the 3-week period (reported through immediate notifications)

**Americas**
- **Subtype H5**
  - Occurrence in unusual host (*Otaria flavescens*) started in Chile (Antofagasta) on 10 February 2023.
HIGH PATHOGENICITY AVIAN INFLUENZA (HPAI) – SITUATION REPORT

11/03/2023

Asia
Subtype H5N1
A recurrence started in Chinese Taipei (Chinese Taipei) on 14 January 2023 (Clade 2.3.4.4b - Lineage: Fully Eurasian).
A recurrence of the strain started in Nepal (Bagmati Pradesh) on 9 February 2023.

Europe
Subtype H5N5
A recurrence of the strain started in Sweden (Vellinge) on 19 February 2021.
Subtype H5N1
A recurrence started in Spain (Cataluña) on 5 January 2023.
Occurrence in unusual host (Vulpes vulpes) started in France (Île-de-France) on 10 February 2023 (Clade: 2.3.4.4b - Lineage: Reassortment Eurasian and North American).

Africa, and Oceania
No events reported

Epidemiological background

High pathogenicity avian influenza (HPAI) is caused by influenza A viruses in the family Orthomyxoviridae. Since its identification in China (People's Rep. of) in 1996, there have been multiple waves of intercontinental transmission of the H5Nx Gs/GD lineage virus. HPAI has resulted in the death and mass slaughter of more than 316 million poultry worldwide between 2005 and 2021, with peaks in 2021, 2020 and 2016. During each of the years 2006, 2016, 2017 and 2021, more than 50 countries and territories in the world were affected with HPAI. In addition, up to now, humans have occasionally been infected with subtypes H5N1 (around 870 cases reported, of which half died), H7N9 (around 1,500 cases reported, of which about 600 died), H5N6 (around 80 cases reported, of which about 30 died), H9N2 (around 80 cases reported, of which 2 died) and sporadic cases have been reported with subtypes H3N8, H7N4, H7N7 and H10N3.8,6,4,5,6,7,8.

Key messages

The current HPAI epidemic season continues with 44 outbreaks being reported in poultry and about 160 in non-poultry birds over the 3 weeks covered by the report, mainly in Europe, and also in the Americas and Asia. Outbreaks are also spreading further to Central America countries. It is worth highlighting the first occurrence of HPAI in poultry in Argentina, and the first occurrence of HPAI in non-poultry birds in Uruguay. The report of HPAI in mammals (in Chile and France) highlights virus spillover to mammalian hosts. About 2.2 million poultry birds died or were culled worldwide during the 3 weeks covered by the report. The predominant subtype noticed in the current epidemic season is still subtype H5N1. Based on the HPAI seasonal pattern, the number of outbreaks in animals is expected to have passed the peak and start to decline.

On 23 February 2023, Cambodia reported one confirmed case of human infection with avian influenza A (H5N1) virus to WHO. A second case, a family contact of the first case, was reported on 24 February 2023. These are the first two human cases of avian influenza A (H5N1) reported from Cambodia since 2014.

The World Organisation for Animal Health (WOAH) recommends that countries maintain their surveillance efforts, biosecurity measures at farm level, and continue timely reporting of avian influenza outbreaks in both poultry and non-poultry species. WOAH also stresses the importance of reporting outbreaks of avian influenza in unusual hosts, as it has been noted that the virus has been increasingly detected in mammals in recent months, a situation that should be monitored. High quality of information is key to support early detection and rapid response to potential threats to both animal and public health.

Visit our website for more information on avian influenza. For any press inquiry on the disease, you can email us at media@woah.org
