Situation report period covered: 21 April to 4 May 2023

This report provides an update of the high pathogenicity avian influenza (HPAI) situation, according to the information submitted through the World Animal Health Information System of the World Organisation for Animal Health (WAHIS) between 21 April and 4 May 2023.

Seasonal trend

Using data reported to the World Organisation for Animal Health (WOAH) between 2005 and 2019 by 76 affected countries and territories for 18,620 outbreaks in poultry, we carried out a Seasonal and Trend decomposition using Loess (STL) analysis to determine the seasonal pattern of the disease (detailed methodology presented in Awada et al., 2018¹). Based on the data reported to WOAH, spread is lowest in September, begins to rise in October, and peaks in February. Figure 1 shows the global seasonal pattern of HPAI in poultry and the red rectangle indicates where we currently are in the cycle based on the period covered in “recent updates” below.

Recent updates (21/04/2023-04/05/2023)

To describe the current disease situation of HPAI in poultry and in non-poultry birds, this section covers: (a) a list of new events² which started during the 2-week period (reported through immediate notifications); (b) information on events that started before the 2-week period but were still ongoing during that period; (c) the geographic distribution of new outbreaks³ that started during the 2-week period and d) events which started before the 2-week period but were reported during the 2-week period. The different subtypes of HPAI circulating during the 2-week period are also listed below. This information is based on the immediate notifications and follow-up reports received by WOAH.

HPAI in poultry

New events by world region (reported through immediate notifications)

Europe
H5N1
A recurrence started in Denmark (Veterinary Inspection Unit South) on 24 April 2023
A recurrence started in Czech Republic (Moravskoslezský) on 30 April 2023 (Clade 2.3.4.4b; Lineage: Fully Eurasian)
Africa, Americas, Asia, and Oceania
No new events reported

² As defined in Article 1.1.2. of the WOAH Terrestrial Animal Health Code, an “event” means a single outbreak or a group of epidemiologically related outbreaks of a given listed disease or emerging disease that is the subject of a notification. An event is specific to a pathogenic agent and strain, when appropriate, and includes all related outbreaks reported from the time of the initial notification through to the final report. Reports of an event include susceptible species, the number and geographical distribution of affected animals and epidemiological units.
³ As defined in the glossary of the WOAH Terrestrial Animal Health Code, an “outbreak” means the occurrence of one or more cases in an epidemiological unit.
On-going events for which there were new reported outbreaks, by world region (reported through follow-up reports):

**Africa**
- Subtype H5
- South Africa

**Americas**
- Subtype H5
- Argentina
- Subtype H5N1
- Canada (Clade: 2.3.4.4b - Lineage: Reassortment Eurasian and North American)

**Europe**
- Subtype H5N1
- Hungary and Italy

**Asia, and Oceania**
- No new outbreaks reported in the on-going events, or no on-going events

New outbreaks and associated subtypes

During the period covered by this report, a total of 12 new outbreaks in poultry were reported by seven countries (Argentina, Canada, Czech Republic, Denmark, Hungary, Italy, South Africa). Details are presented in Figures 2 and 3.

*Figure 2. Distribution of HPAI new outbreaks in poultry, and corresponding subtypes*
Events which started before the 2-week period but were reported during the 2-week period (reported through immediate notifications)

**Americas**
- **H5**
  - The first occurrence in the area of Maule started in Chile on 6 April 2023

**Africa**
- **H5**
  - A recurrence in South Africa (Western Cape) started on 18 April 2023

**Asia, Europe, and Oceania**
- No events reported

**HPAI in non-poultry**

New events by world region (reported through immediate notifications)

- **Africa, Asia, Americas, Europe, and Oceania**
  - No new events reported

On-going events for which there were new reported outbreaks, by world region (reported through follow-up reports):

**Americas**
- **H5 in birds**
  - Argentina

**Europe**
- **H5N1 in birds**
  - Austria, Czech Republic (Clade 2.3.4.4b - Lineage: Fully Eurasian), Germany, Lithuania, Poland, Sweden, United Kingdom

**Africa, Asia, and Oceania**
  - No new outbreaks reported in the on-going events, or no on-going events.

**New outbreaks**

During the period covered by this report, a total of 13 outbreaks in non-poultry were reported by eight countries (Argentina, Austria, Czech Republic, Germany, Lithuania, Poland, Sweden, United Kingdom). All outbreaks were reported for birds. Details are presented in Figures 4 and 5.
Figure 4. Distribution of HPAI new outbreaks in non-poultry animals, and corresponding subtypes. All new outbreaks reported during the 2-week period were in birds.

Figure 5. Number of new outbreaks by geographical region

Events which started before the 2-week period but were reported during the 2-week period (reported through immediate notifications or through emails)

**Africa**
H5 in birds
A recurrence started in South Africa (Gauteng and Western Cape) on 8 March 2023

**Americas**
H5N1 in mammals
Occurrences in marine mammals (Chilean dolphin [*Cephalorhynchus Eutropia*] and Burmeister's porpoise [*Phocoena spinipinnis*]) started in Chile (Antofagasta, Atacama, Maule) on 27 March 2023

**Asia**
H5N1 in mammals
An occurrence in unusual host (red fox [*Vulpes vulpes*]) started in Japan (Hokkaido) on 12 April 2023

**Europe**
Epidemiological background

High pathogenicity avian influenza (HPAI) is caused by influenza A viruses in the family Orthomyxoviridae. Since its identification in China (People’s Rep. of) in 1996, there have been multiple waves of intercontinental transmission of the H5Nx Gs/GD lineage virus. HPAI has resulted in the death and mass slaughter of more than 316 million poultry worldwide between 2005 and 2021, with peaks in 2021, 2020 and 2016. During each of the years 2006, 2016, 2017 and 2021, more than 50 countries and territories in the world were affected with HPAI. In addition, up to now, humans have occasionally been infected with subtypes H5N1 (around 870 cases reported, of which half died), H7N9 (around 1,500 cases reported, of which about 600 died), H5N6 (around 80 cases reported, of which about 30 died), H9N2 (around 80 cases reported, of which 2 died) and sporadic cases have been reported with subtypes H3N8, H7N4, H7N7 and H10N3.

Key messages

The current HPAI epidemic season continues with 12 outbreaks being reported in poultry and 13 in non-poultry birds over the 2 weeks covered by the report, mainly in Europe, and also in the Americas and Africa. Nearly 300,000 poultry birds died or were culled worldwide during the 2 weeks period. Based on the HPAI seasonal pattern, the number of outbreaks in animals is expected to have passed the peak and decline. There has been a slight decrease since the previous periodic reports.

The World Organisation for Animal Health (WOAH) recommends that countries maintain their surveillance efforts, biosecurity measures at farm level, and continue timely reporting of avian influenza outbreaks in both poultry and non-poultry species.

WOAH also stresses the importance of reporting outbreaks of avian influenza in unusual hosts, as the virus has been increasingly detected in mammals in recent months, a situation that should be monitored.

High quality of information is key to support early detection and rapid response to potential threats to both animal and public health.
